1. Introduction

This guide covers how to use the uEZ Project Maker. The uEZ Project Maker will create a simple Jump Start project to help get you started with uEZ on one of FDI's touchscreen kits.

2. Running the Project Maker

To run the project maker, run the uEZProjectMaker.exe in the root of the uEZ_v2.XXX.XXX folder. For Linux a ".sh" script is provided.

- a. Run the application.

- b. Follow the instructions on each screen to select the RTOS, processor, platform, and IDE you'll be using.
- c. When prompted enter the project name.
- d. When prompted select a directory where you would like the project to be created. This project maker version will automatically select the current path, which will be correct for the adjacent uEZ folder.
- e. At the summary screen, verify all the information is correct and press the <Create> button.

- f. On the final screen, the Project Maker will provide a link to the new project build directory on your computer and a web link for downloading uEZ.

- g. When running uEZ Project Maker from the uEZ release package, the uEZ folder will already be present in the project's root directory. This is the directory that you told the project maker to create your project.

- h. Before you can compile and run your new project, you'll need to compile the uEZ library project in the uEZ directory. This can be found by following navigating to uEZ/Build/Generic/[Manufacturer]/[processor]/[RTOS]/[IDE]/.
- i. Open the library project found at this location and compile it. Now you should be able to open your new application project, compile and run. For more information on how to do this, please refer to the "uEZ QuickStart Guide"
